EXERCISE 2: CREATE YOUR FIRST INCIDENT TICKET

SCENARIO: The Monday Morning Incident at ABC Corporation

It is Monday, November 18, 2024, at 09:14 AM. You are the Tier 1 analyst on morning duty at ABC Corporation, a Philippine BPO company with 500 employees in Makati City.

Your SIEM (Splunk) generates an alert: "ALERT: Multiple failed login attempts — Account: jdelacruz@abccorp.ph — 47 failed attempts from IP 45.142.212.100 (Germany) between 08:50 AM and 09:14 AM — Source: Office365 Login Logs"

At 09:17 AM, you receive a phone call from Juan de la Cruz himself (Employee ID: EMP-1042, Customer Service Department, Extension 204). He says he received an email this morning from "IT Support" asking him to click a link to verify his account due to "suspicious activity." He clicked the link and entered his login credentials on a page that looked like the company's official Office365 login page. The page then gave an error message. His account is currently locked.

You check VirusTotal for IP 45.142.212.100 — it shows 34 out of 90 security vendors flagging it as malicious, associated with credential theft campaigns. You check the Office365 admin panel and see that before the lockout, there was ONE successful login from the same German IP at 08:49 AM — one minute before the failed attempts started.

INCIDENT TICKET

Ticket ID:	ABC-2024-00001
Priority:	**Critical**
Status:	**In Progress** (escalated to Tier 2)
Incident Type:	Phishing / Account Compromise
Created:	November 18, 2024, 09:14 AM (Splunk alert)
Reporter:	Juan de la Cruz (EMP-1042), Customer Service Dept., Ext. 204 (phone, 09:17 AM)
Assigned To:	Glenn Doe, Tier 1 SOC Analyst (Morning Shift)
Detection Source/s:	Splunk SIEM (O365 login logs), VirusTotal, O365 Admin Panel

DESCRIPTION

On November 18, 2024, a phishing email impersonating IT Support led Juan de la Cruz to enter his credentials on a fake Office 365 login page. The attacker **successfully logged in** to his account from 45.142.212.100 (Germany) at 08:49 AM. Splunk then detected 47 failed login attempts from the same IP between 08:50 and 09:14 AM. VirusTotal flags the IP as malicious (34 of 90 vendors) and associates it with credential theft campaigns. The account is now locked. Whether the attacker accessed company data or took unauthorized actions has not yet been determined.

ACTIONS TAKEN

- **09:14 AM:** Reviewed the Splunk alert and identified 47 failed login attempts from the suspicious German IP.
- **09:17 AM:** Received a phone report from the user about the phishing email and credential submission.
- **09:18 AM:** Checked the IP in VirusTotal; 34 of 90 vendors flagged it as malicious.
- **09:20 AM:** Reviewed the O365 Admin Panel and confirmed a successful login from the same IP at 08:49 AM.
- **09:22 AM:** Confirmed the account is locked.
- Escalated to Tier 2 SOC for further investigation.

RESOLUTION

Pending investigation. The account is locked, but the incident is not resolved. The suspected root cause is a phishing attack that exposed the user's Office 365 credentials. Further investigation is required to determine whether the attacker accessed company data or performed unauthorized actions.
